ARE YOU EXPECTING TWINS?

YOU MAY BE ELIGIBLE TO TAKE PART IN THE IONA® TWIN STUDY

The IONA® test is a prenatal screening test for Down’s, Edwards’ and Patau’s syndromes.

It works by analysing placental DNA which is present in the mother’s blood.

Taking part involves a blood test and answering some questions.

Participation is voluntary and you will receive results of the test, which is performed using your donated sample.

In the IONA® Twin Study, we are assessing how the test performs in twin pregnancies.

You can find out more information about this study from your midwife/doctor who will see you in clinic.

It is hoped that further development of the IONA® test would avoid having to perform unnecessary invasive tests in twin pregnancies in the future.
